AI Applications in Marketing Strategy

Teaching students to build, test, and defend.

Prof. Mike Tadesse

- Google AI Higher Ed Fellow
- GW TAI: Incoming Research Infrastructure Lead

GWSB Marketing Department

Our philosophy

AI Changes What Students Can Create. Education Shapes What They Can Do With It.

Coached experiential learning helps them develop the understanding and judgment to make that work useful.

- Capability = What technology makes possible
- Judgement = What education develops

You belong here

Different starting points. A shared responsibility to grow.

Know the person

Understand students' backgrounds, interests, confidence and aspirations

Connect to Industry

Bring emerging practices and changing professional expectations into the classroom.

Outwork self-doubt

Encourage experimentation, feedback, persistence, and improvement.

Test assumptions

Challenge students to explain decisions, gather evidence, and revise their thinking.

Grow Together

Share knowledge, contribute to teams, and support one another.

Own the work

Take responsibility for decisions, results, and what comes next.

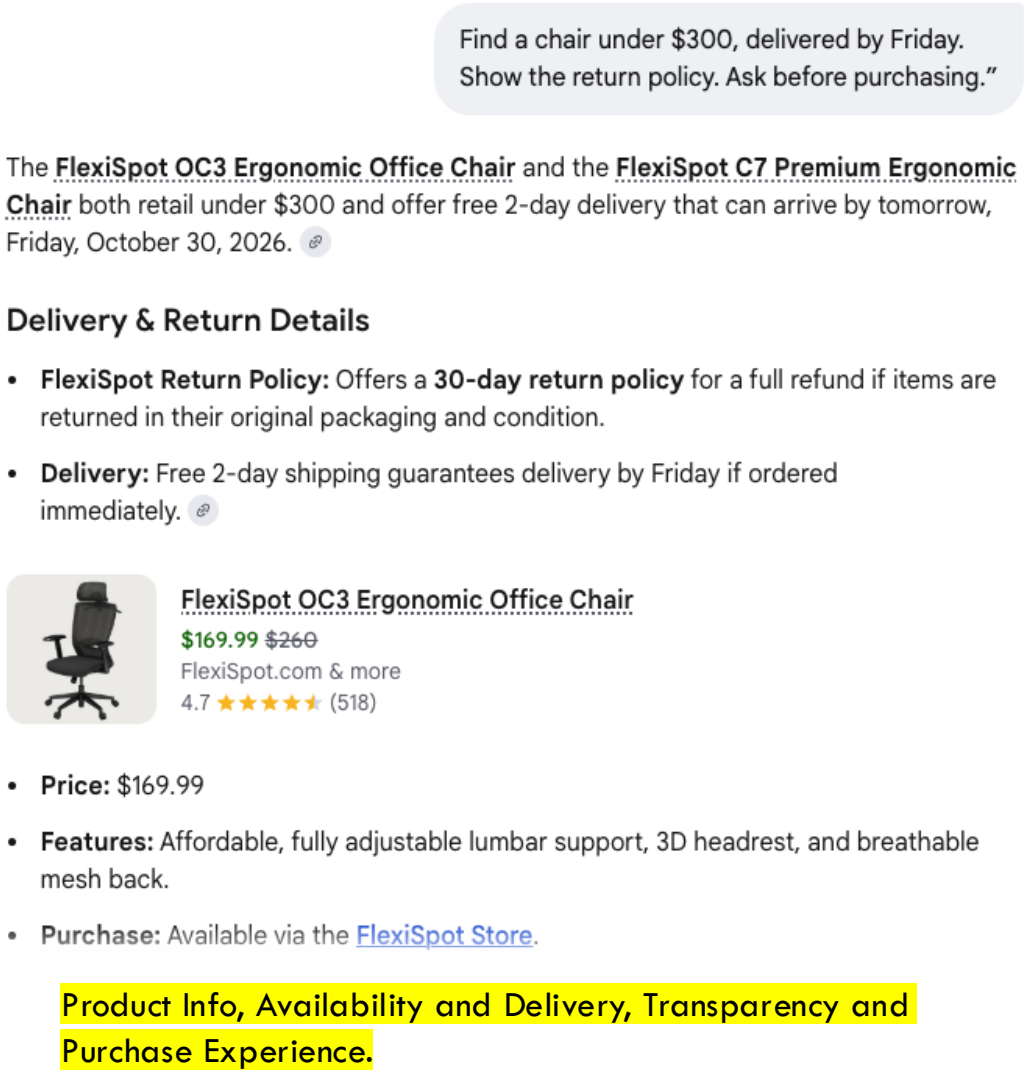

Marketing Has Always Been About Creating Value. The Tools Keep Changing.

Marketing environment	What became possible	What marketers must understand
Brand, product, and channel-led	Reach audiences through products, communications, distribution, and service	Customer needs, segmentation, positioning, pricing, and brand
Digital and data-connected	Observe behavior and coordinate acquisition, personalization, conversion, and retention	Customer journeys, experimentation, CAC, lifetime value, and privacy
AI-enabled and increasingly agent-mediated	Generate experiences, interpret requests, and delegate parts of discovery, service, and purchasing	System behavior, information quality, permissions, platform dependence, and accountability

What hasn't changed: We still need to understand people, solve problems, and create value.

What Happens When AI Becomes Part of the Customer Journey?

- **Data readiness for human search**
  - Learn: Schema markup and API infrastructure
  - Action: Code clean product feeds before agents crawl them
- **Logistics filtering for AI comparison**
  - Learn: Dynamic logistics analytics and filter mapping
  - Action: Sync real-time delivery data to pass AI constraints
- **Trust engineering for bot validation**
  - Learn: Machine-readable policy formatting
  - Action: Simplify return terms to bypass bot risk blocks
- **Checkout triggers for agentic action**
  - Learn: Zero-click purchasing and machine checkout
  - Action: Enable instant transaction triggers for bot buyers

A Working AI Product Is Not Necessarily a Valuable Product.

Students must learn to…	Because…
Understand customers	Personalization is useful only when it addresses a genuine need
Choose a market and position an offer	Easier production does not establish demand or differentiation
Build and explain a workflow	The customer experience depends on what the system actually does
Design distribution and adoption	A functioning product still needs a credible route to users
Measure customer and business value	Engagement or conversion alone can hide poor outcomes
Set and test boundaries	Automation introduces questions about permission, error, and responsibility

Three Ways Students Learn by Doing

Technical Fluency

Explore unfamiliar technologies, build practical skills, and understand what the tools can and cannot do.

Independent Project

Identify a problem connected to a career, organization, or community. Develop and test a solution.

Team Capstone

Bring together customer research, marketing strategy, technology, and business economics to solve a real problem.

Don't build confidence.

Build evidence.

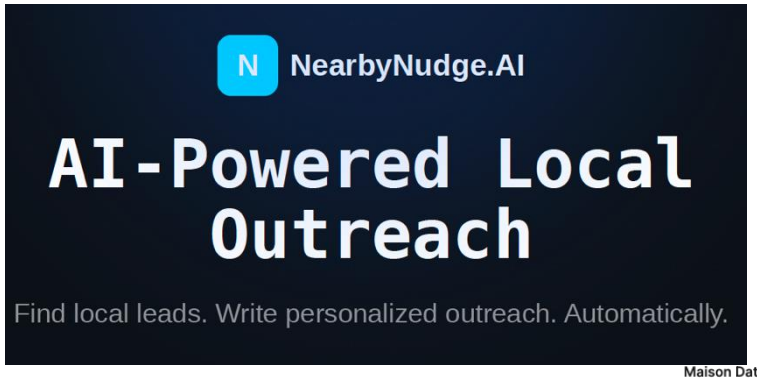

Confidence comes as a result of evidence.

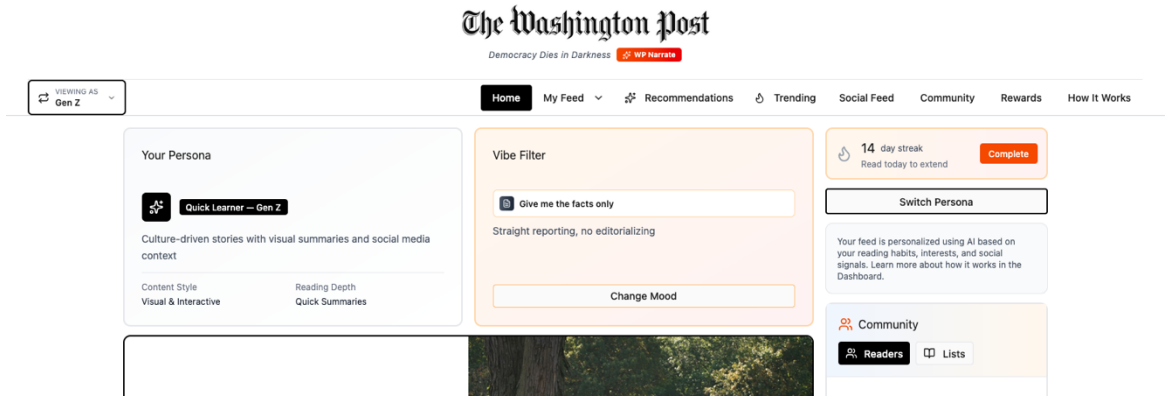

Not the other way around.

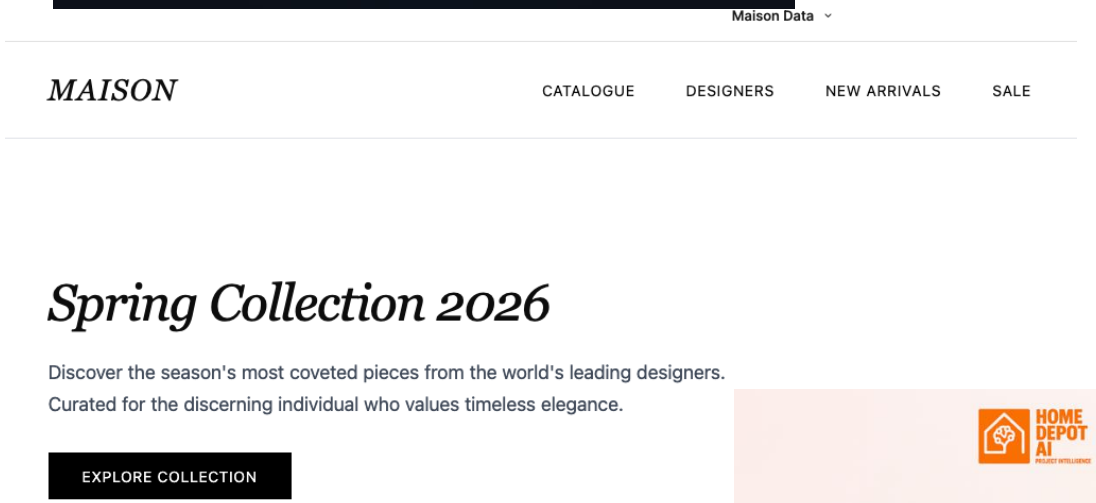

Capability Judgment Development Transfer

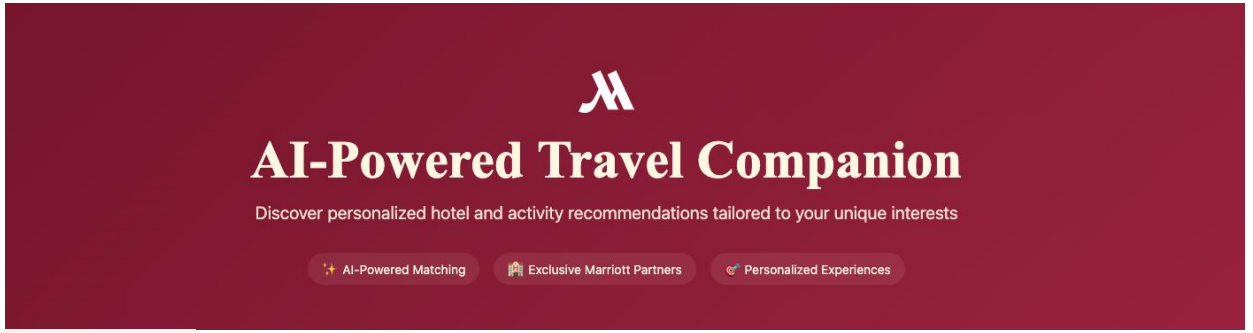

What our students built so far..

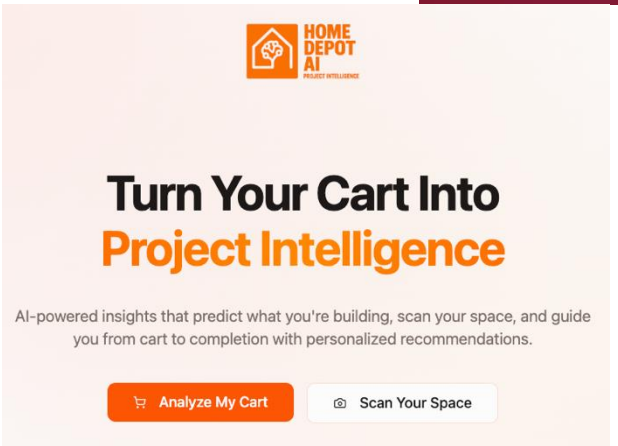

From classroom ideas to working prototypes and new business concepts.

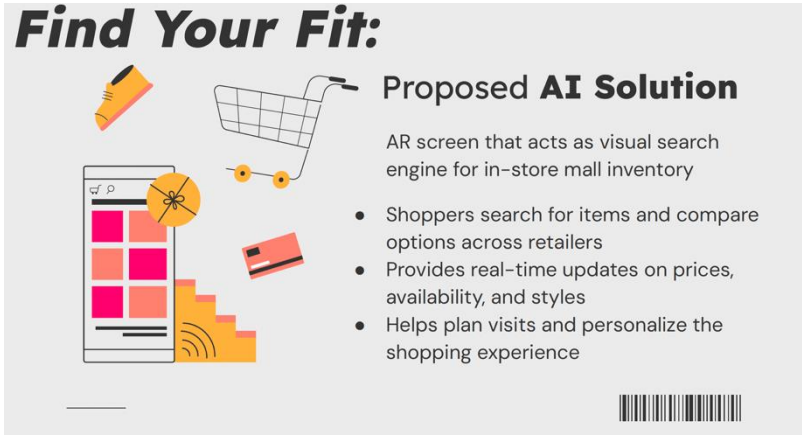

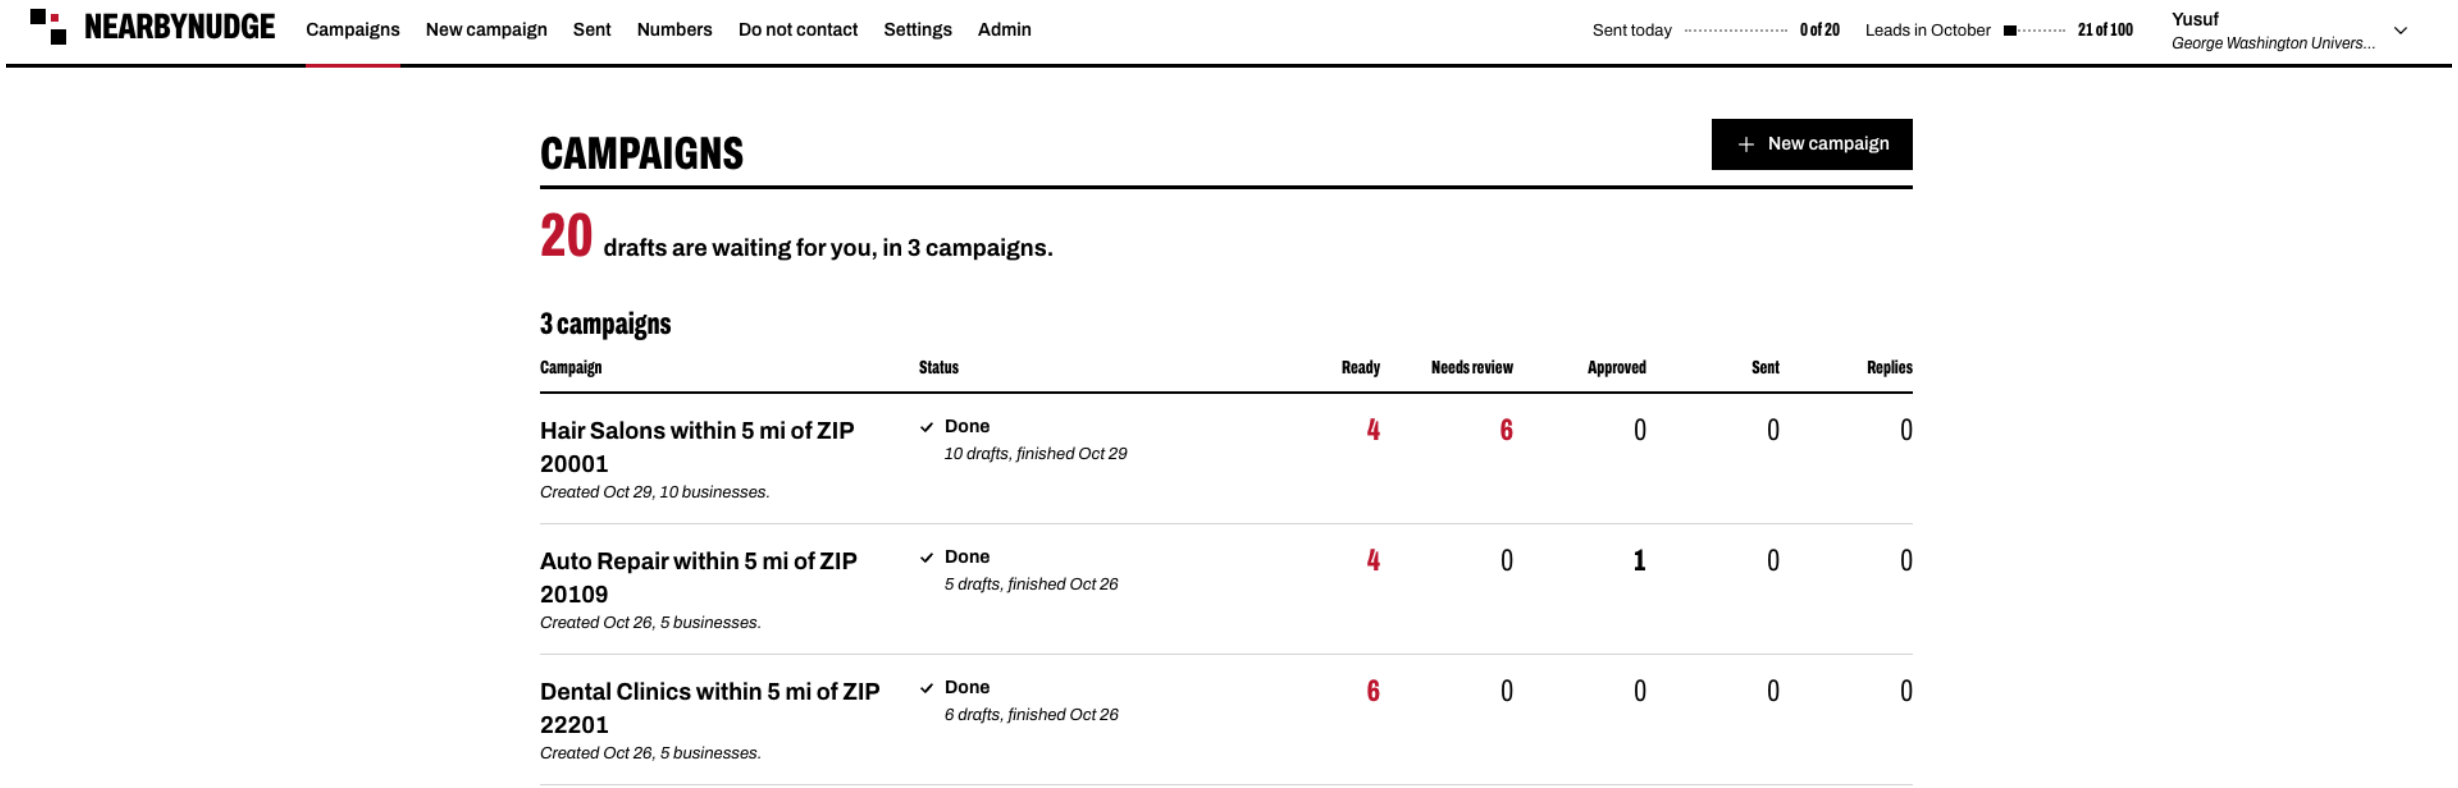

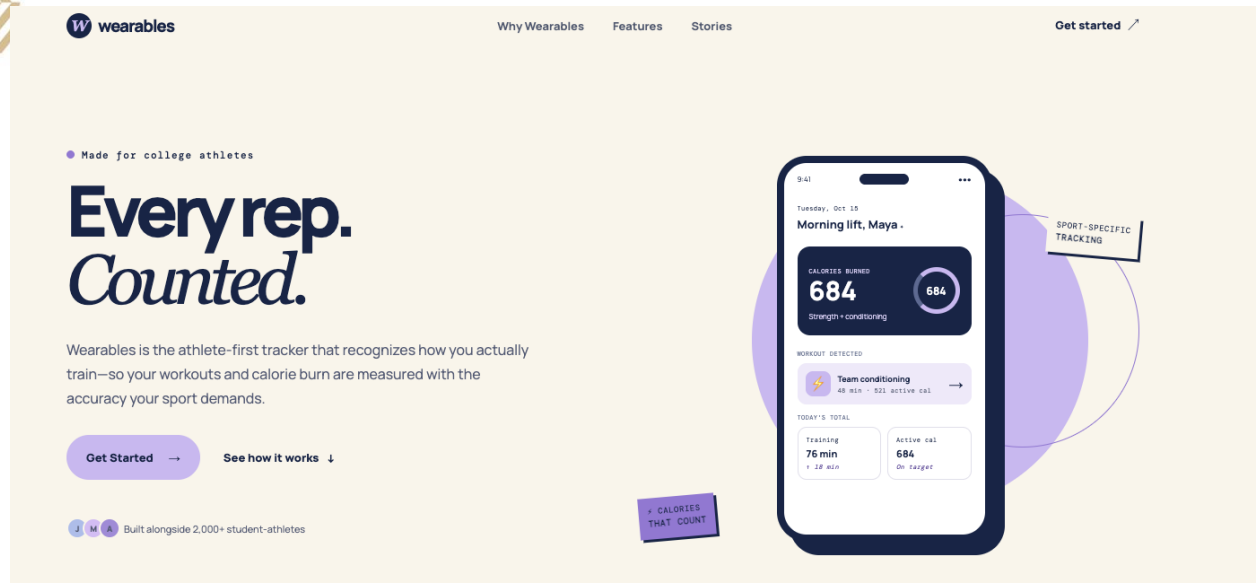

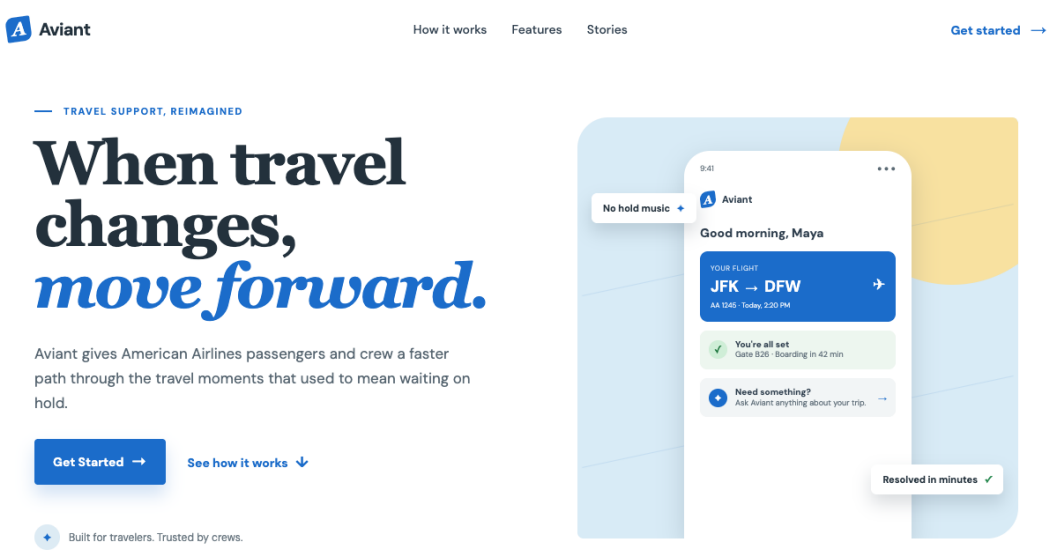

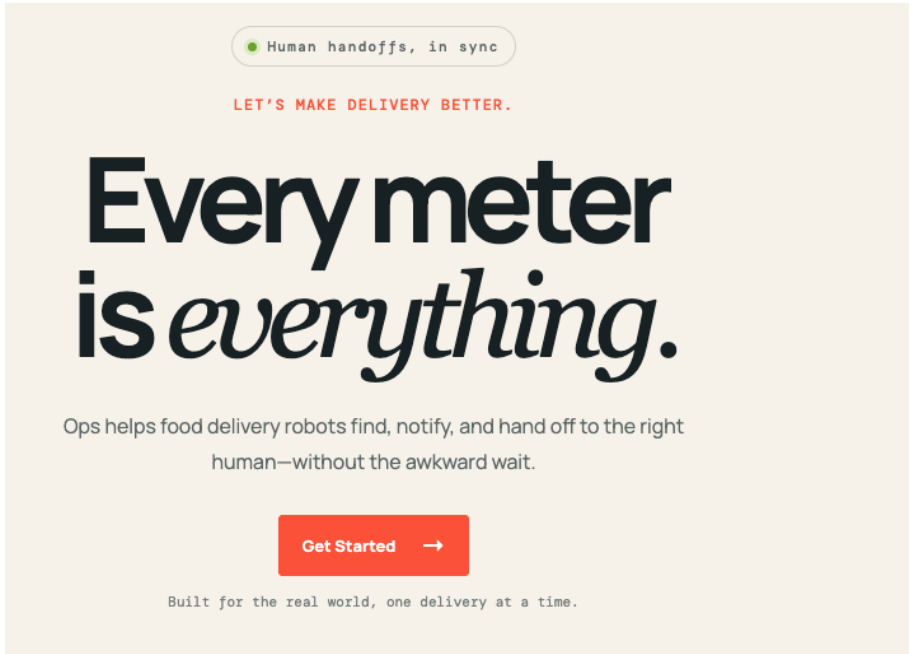

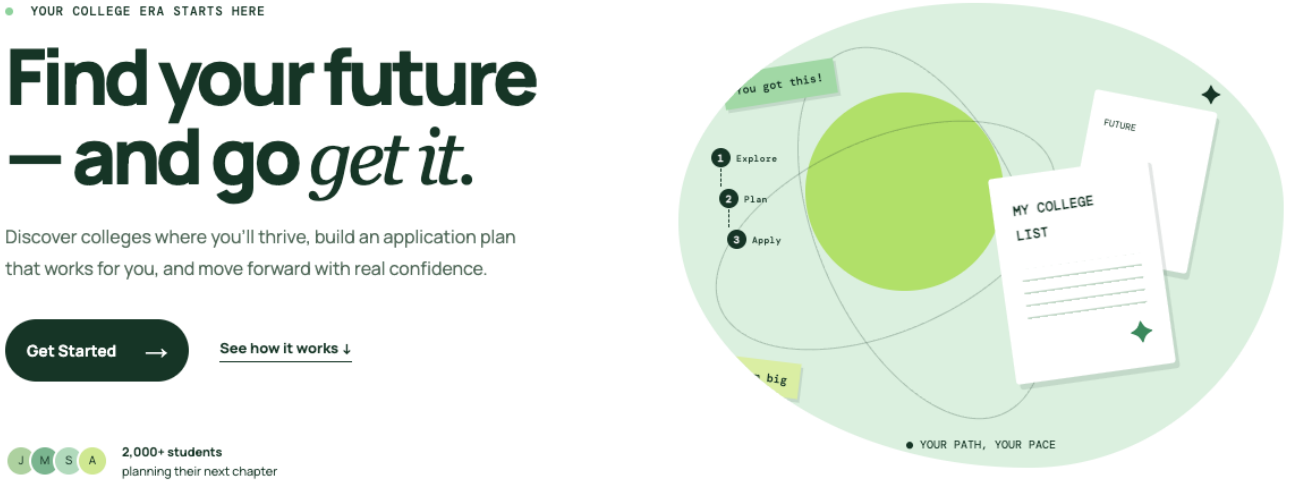

AI researches potential customers and drafts outreach. A person reviews the facts, approves the message, and decides whether to send it.

wearables
Why Wearables
Features

TRAVEL SUPPORT, REIMAGINED
When travel changes, move forward.
Aviant gives American Airlines passengers and crew a faster path through the travel moments that used to mean waiting on hold.
Get Started
See how it works
Built for travelers. Trusted by crews.
No hold music
Good morning, Maya
JFK → DFW
You're all set
Need something?
Resolved in minutes

Human handoffs, in sync
LET'S MAKE DELIVERY BETTER.
Every meter is everything.
Ops helps food delivery robots find, notify, and hand off to the right human—without the awkward wait.
Get Started
Built for the real world, one delivery at a time.

YOUR PATH, YOUR PACE

Tassl at Google Higher Ed Fellowship Demo

A decision simulator where students practice professional judgment with AI, then demonstrate their reasoning independently.

PRODUCT CATEGORY	DESIGNED TO HELP STUDENTS	EVIDENCE LEFT BEHIND
AI Assistants	Research, analyze, create, and complete work	Conversation and completed work
AI Learning Tools	Understand concepts and practice with guidance	Learning activity and progress
Business Simulations	Make decisions and experience outcomes	Decision and outcome
Tassl	Practice professional judgments with AI under controlled conditions	Independent frame, reliance choices, adaptation, and unaided defense

STUDENT SIDE

Create the evidence

Frame a position before AI

Choose a stance on consequential claims

Lock the decision, respond to the Turn

Defend the reasoning without AI

INSTRUCTOR SIDE

Review the evidence

Replay the decision sequence

See claims, sources, confidence, and timing

Review the unaided defense at the exact gap

Confirm or change the evidence-linked assessment

Overdeliver value for the price. Think like the customer. Never cut corners to protect margins.

The principles we teach in business should be the same standards we uphold in education.

Our commitment is to deliver an experience that exceeds their investment, builds lasting capabilities, and prepares them for opportunities beyond the classroom.

THANK YOU
